

CS 241: Systems Programming

Lecture 4. Environment and expansion

Fall 2019

Prof. Stephen Checkoway

Commands, again

Recall we said a simple command has the form:

⟨variable assignments⟩ ⟨words and redirections⟩ ⟨control operator⟩

Examples

- ▶ FOO=blah BAR=okay cmd aaa >out bbb 2>err ccc <in ;
- ▶ FOO=blah BAR=okay cmd aaa bbb ccc <in >out 2>err
- ▶ Real example: \$ IFS= read -r var

Environment variables

A (second) method for passing data to a program

Essentially a key/value store (i.e., a hash map)

- ▶ `$ FOO=blah BAR=okay cmd aaa bbb ccc`
- ▶ `cmd` has access to the `FOO` and `BAR` environment variables plus args

Environment variables are inherited from the parent

- ▶ Every program started from the shell has access to a copy of the shell's environment

Bash variables

Setting and using variables in bash

- `$ place=Earth`
`$ echo "Hello ${place}."`
Hello Earth.

By default, variables set in bash aren't inherited by children

- `$ bash # Start a new shell`
`$ echo "Hello ${place}."`
Hello . # `${place}` expanded to the empty string

Exporting variables

We can **export** a variable which causes it to appear in the environment of children

```
$ place=World
$ export place
$ bash          # Starting a new shell
$ echo "Hello ${place}."
Hello World.
```

Equivalently, `$ export place=World`

Summarizing

```
$ FOO=bar cmd1
```

```
$ cmd2
```

- FOO available to cmd1 but not cmd2

```
$ FOO=bar
```

```
$ cmd1
```

```
$ cmd2
```

- FOO not available to either cmd1 or cmd2

```
$ export FOO=bar
```

```
$ cmd1
```

```
$ cmd2
```

- FOO available to both cmd1 and cmd2

Useful environment variables

- EDITOR — Used when some commands need to launch an editor (e.g., git)
- HOME — Your home directory
- LANG — The language programs should use (this is complicated!)
- PAGER — A program like less that's used to display pages of text
- PATH — Colon-separated list of directories to search for commands
- PS1 — The shell's prompt
- PWD — The current working directory
- SHELL — The shell you're using
- TERM — The terminal type, used to control things like color support
- UID — The real user ID number
- USER — User name

Bash expansion

Bash first splits lines into words by (unquoted) space or tab characters

```
$ echo 'quoted string' unquoted string
```

- ▶ Word 1: echo
- ▶ Word 2: 'quoted string'
- ▶ Word 3: unquoted
- ▶ Word 4: string

Most words then undergo **expansion**

- ▶ The values in variable assignment `var=value` (but not the names)
- ▶ The command and arguments
- ▶ The right side of redirections, e.g., `2>path`

Bash expansion

Order of expansion

- Brace expansion
- In left-to-right order, but at the same time
 - Tilde expansion
 - Variable expansion
 - Arithmetic expansion
 - Command expansion
 - Process substitution
- Word splitting (yes, this happens after the shell split the input into words!)
- Pathname expansion

And then each of the results undergoes quote removal

Brace expansion

Unquoted braces { } expand to multiple words

- ▶ `{foo,bar,baz}.txt` → `foo.txt bar.txt baz.txt`
- ▶ `foo{a,b,,c}bar` → `fooabar foobbar foobar fooobar`
- ▶ `'{a,b}'` → `'{a,b}'`
- ▶ `"{a,b}"` → `"{a,b}"`
- ▶ `{1..5}` → `1 2 3 4 5`
- ▶ `{x..z}` → `x y z`
- ▶ `{1,2}{x..z}` → `1x 1y 1z 2x 2y 2z`
- ▶ `{a,b{c,d}}` → `a bc bd`

Tilde expansion

Words starting with unquoted tildes expand to home directories

- ▶ `~` → `/usr/users/noquota/faculty/steve`
- ▶ `~steve` → `/usr/users/noquota/faculty/steve`
- ▶ `~aeck` → `/usr/users/noquota/faculty/aeck`
- ▶ `\~steve` → `\~steve`
- ▶ `'~steve'` → `'~steve'`

Parameter/variable expansion

We can assign variables via `var=value` (e.g., `class='CS 241'`) the shell defines others like `HOME` and `PWD`

Words containing `${var}` or `$var` are expanded to their value, even in double quoted strings

- ▶ `${HOME}` → `/usr/users/noquota/faculty/steve`
- ▶ `x${PWD}y` → `x/tmpy` # the current working directory
- ▶ `x$PWDy` → `x` # no `PWDy` variable so it expands to the empty string
- ▶ `'${class}'` → `'${class}'`
- ▶ `\${class}` → `\${class}`
- ▶ `"${class}"` → `"CS 241"`

Command substitution

Replaces `$(command)` with its output (with the trailing newline stripped)

- `"Hello $(echo ${class} | cut -c 4-)" → "Hello 241"`

These can be nested

You can also use ``command`` instead, but don't do that, use `$(...)`

Arithmetic expansion

`$((arithmetic expression))` expands to the result, assume `x=10`

- ▶ `$ ((3+x*2 % 6))` → 5
- ▶ `\$ ((3+x*2 % 6))` → # syntax error
- ▶ `'$ ((3+x*2 % 6))'` → `'$((3+x*2 % 6))'`
- ▶ `"$ ((3+x*2 % 6))"` → `"5"`

Process substitution

Read the man page for bash if you want, we may come back to it

Word splitting

A misfeature in bash!

The results of
parameter/variable expansion `${...}`,
command substitution `$(...)`, and
arithmetic expansion `$((...))`

not in double quotes is split into words by splitting on (by default) space, tab, and newline

```
steve@clyde:~$ x='foo    bar'
steve@clyde:~$ echo ${x}
foo/bar-fall (bash) %1    ...als/S
steve@clyde:~$ echo "${x}"
foo    bar
research/cswwww/_cour
```

You never want word splitting! If you're using a \$, put it in double quotes!

Pathname expansion

We saw this last time!

Pathname expansion/globbing

Bash performs pathname expansion via **pattern matching** (a.k.a. **globbing**) on each unquoted word containing a wild card

Wild cards: *****, **?**, **[**

- ***** matches zero or more characters
- **?** matches any one character
- **[...]** matches any single character between the brackets, e.g., **[abc]**
- **[!...]** or **[^...]** matches any character not between the brackets
- **[x-y]** matches any character in the range, e.g., **[a-f]**

Quote removal

Unquoted ', ", and \ characters are removed in the final step

- ▶ 'foo bar' → foo bar (one word)
- ▶ "foo bar" → foo bar (one word)
- ▶ "\${class}" → CS 241 (one word)
- ▶ "\${class} is" 'fun' → CS 241 is fun (one word)

Expansion summary

Braces form separate words `[{a,b,c}] → [a] [b] [c]`

Tildes give you home directories `~ → /home/steve`

Variables expand to their values `"${class}" → "CS 241"`

Commands expand to their output `"$(ls *.txt | wc -l)" → "3"`

Wildcards expand to matching file names `*.txt → a.txt b.txt c.txt`

Put literal strings in 'single quotes'

Put strings with variables/commands in "\${double} \$(quotes)"

If we have set a variable
`books='Good books'`
and we want to create a directory with that name, which command should we use?

A. `$ mkdir "${books}"`

B. `$ mkdir "$(books)"`

C. `$ mkdir ${books}`

D. `$ mkdir $(books)`

E. `$ mkdir $books`

In-class exercise

<https://checkoway.net/teaching/cs241/2019-fall/exercises/Lecture-04.html>

Grab a laptop and a partner and try to get as much of that done as you can!
