# CS 241: Systems Programming Lecture 5. Version Control/Git

Fall 2019 Prof. Stephen Checkoway

A way to track changes to your files

- What you changed
- Why you changed it

A way to track changes to your files

- What you changed
- Why you changed it

A way to keep "backups" of older versions

A way to track changes to your files

- Why you changed it

A way to keep "backups" of older versions

A way to keep track of different versions (branches) of a project

- Development
- Release

A way to track changes to your files

- What you changed
- Why you changed it

A way to keep "backups" of older versions

A way to keep track of different versions (branches) of a project

- Development
- Release

A way to organize and collaborate on a project

$$SCCS \rightarrow RCS \rightarrow CVS \rightarrow SVN \rightarrow \{Git, Mercurial, ...\}$$

- 1972 Source Code Control System (SCCS)
- 1985 Revision Control System (RCS)
- All users on the same system, each with their own checkout of the files
- 1986 Concurrent Versioning System (CVS)
  - Client/server model
- 2000 Subversion (SVN)
  - Essentially a better CVS
- 2005 Git and Mercurial
  - Distributed model: each user has their own copy of the whole repository

#### SCCS/RCS

- Master repository with all history stored somewhere, e.g., /source/program
- Individual users checkout the current version somewhere else, e.g.,
   ~/program
- Modifications can be checked in to the master repo
- Other users' modifications can be checked out again
- The history of files and their differences can be shown

#### CVS/SVN

- Master repo stored on some server, e.g., vcs.oberlin.edu:/vcs/program
- Users on many different machines can checkout copies, e.g., clyde.cs.oberlin.edu:~/program
- Changes to files are committed to the server which maintains the authoritative copy of the repository history
- Local copies can be updated with other users' changes from the server
- Multiple branches, but each with a linear commit history (r1, r2, r3, ...)

#### Git/Mercurial

- Decentralized
  - Each user has a full copy of the repo
  - No authoritative version
- Users can push changes to other users or pull changes from others
- Multiple, lightweight branches
- History is not linear, it's a DAG (we'll see what this means shortly)
- Decentralization is hard to deal with: use Github (or similar)

A distributed version control system

- Everyone can act as a "server"
- Everyone mirrors the entire repository

#### A distributed version control system

- Everyone can act as a "server"
- Everyone mirrors the entire repository

#### Many local operations

- Quick to add files, commit, create new branches, etc.
- Can have local changes w/o pushing to others

#### A distributed version control system

- Everyone can act as a "server"
- Everyone mirrors the entire repository

#### Many local operations

- Quick to add files, commit, create new branches, etc.
- Can have local changes w/o pushing to others

#### Collaborate with other developers

"Push" and "pull" code from hosted repositories such as Github

### Initial setup

```
$ git config --global user.name 'Stephen Checkoway'
$ git config --global user.email \
    'stephen.checkoway@oberlin.edu'
$ git config --global core.editor vim
```

Global config values are stored in ~/.gitconfig

Can also have local config settings in \${repo}/.git/config

### Creating a repository

```
$ mkdir project
$ cd project
$ git init
```

Creates a .git folder in project

No files are currently being tracked or managed

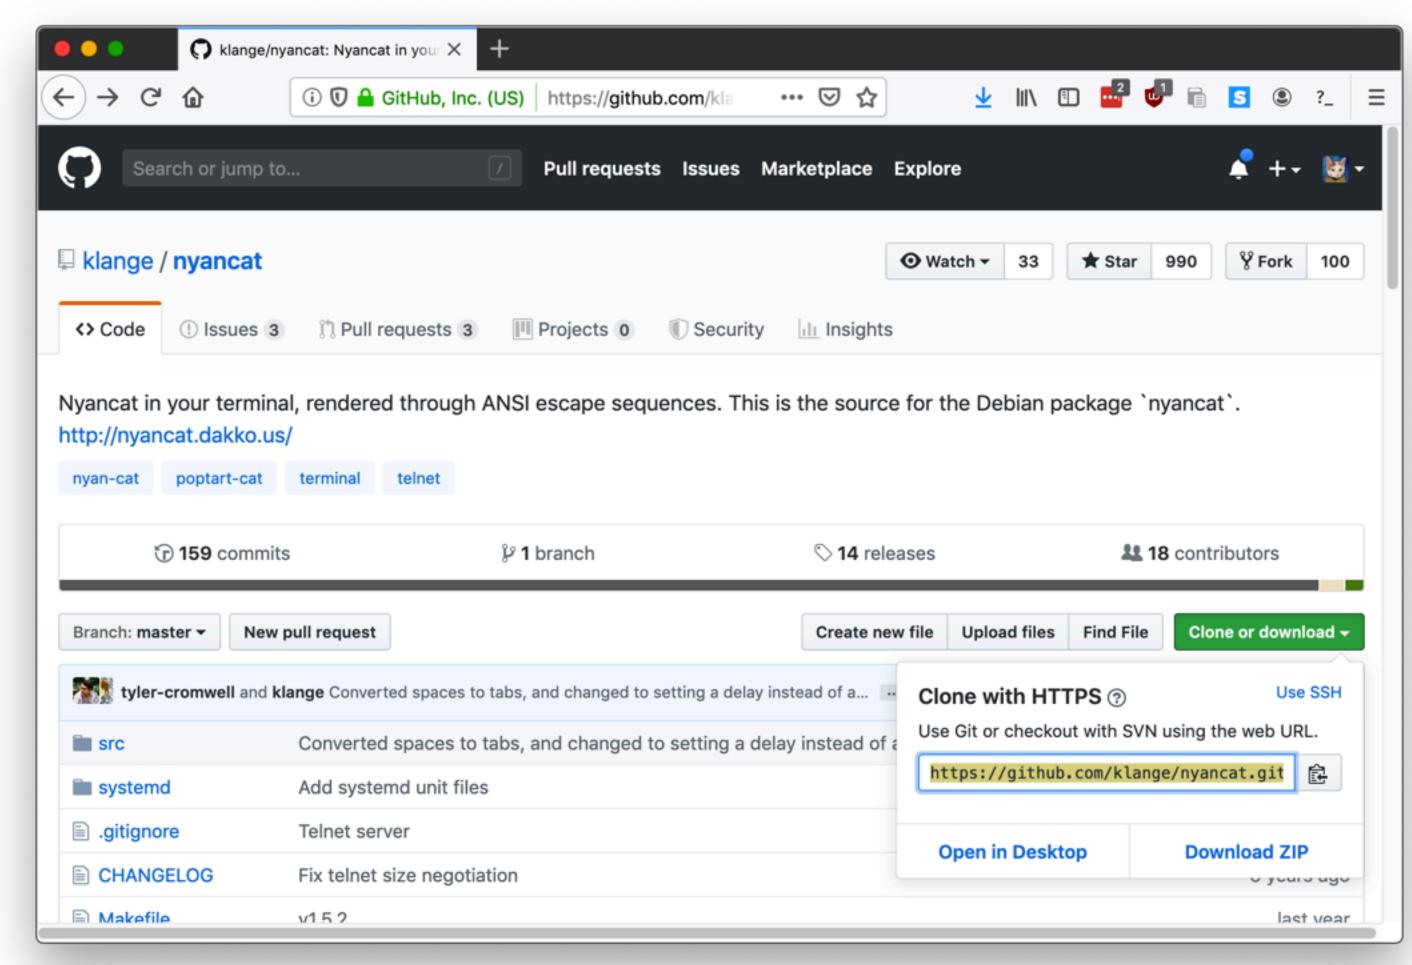

No remote server

### Cloning a (remote) repository

\$ git clone https://github.com/klange/nyancat.git

Creates a local copy of the repoint including the whole history

Associated with a remote server

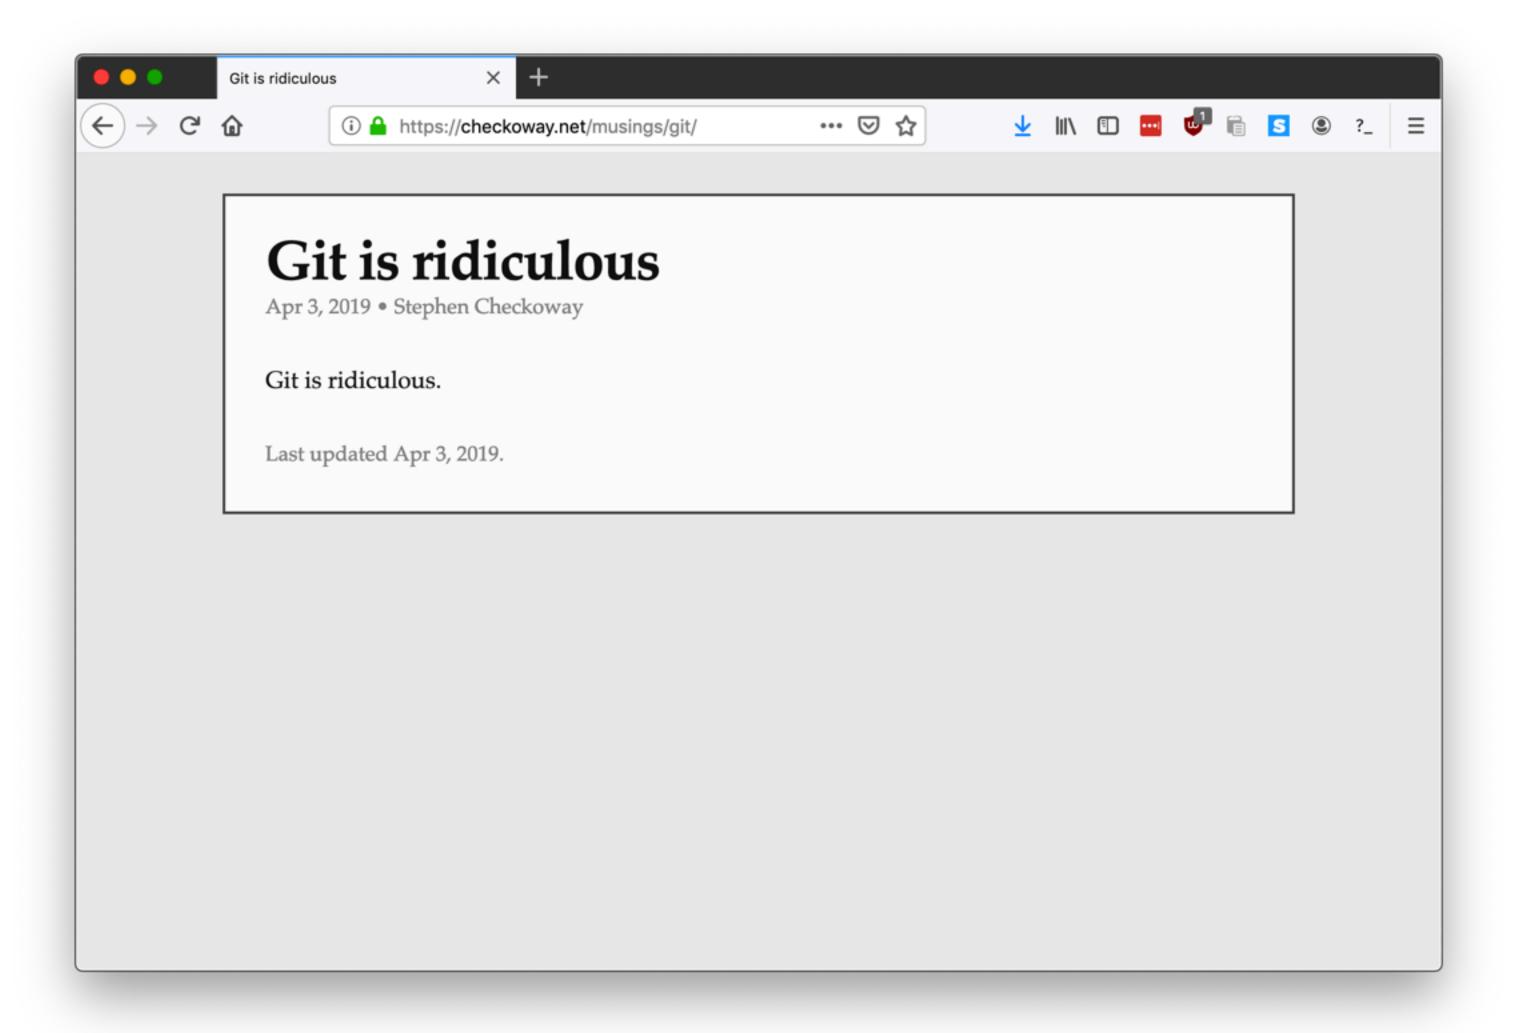

# Cloning a (remote) repository

# Cloning a (remote) repository

### Warning: Git is ridiculous

# Working dir vs staging vs .git

After git init or git clone, you have a working directory on the file system

Holds one version of the files in the repo

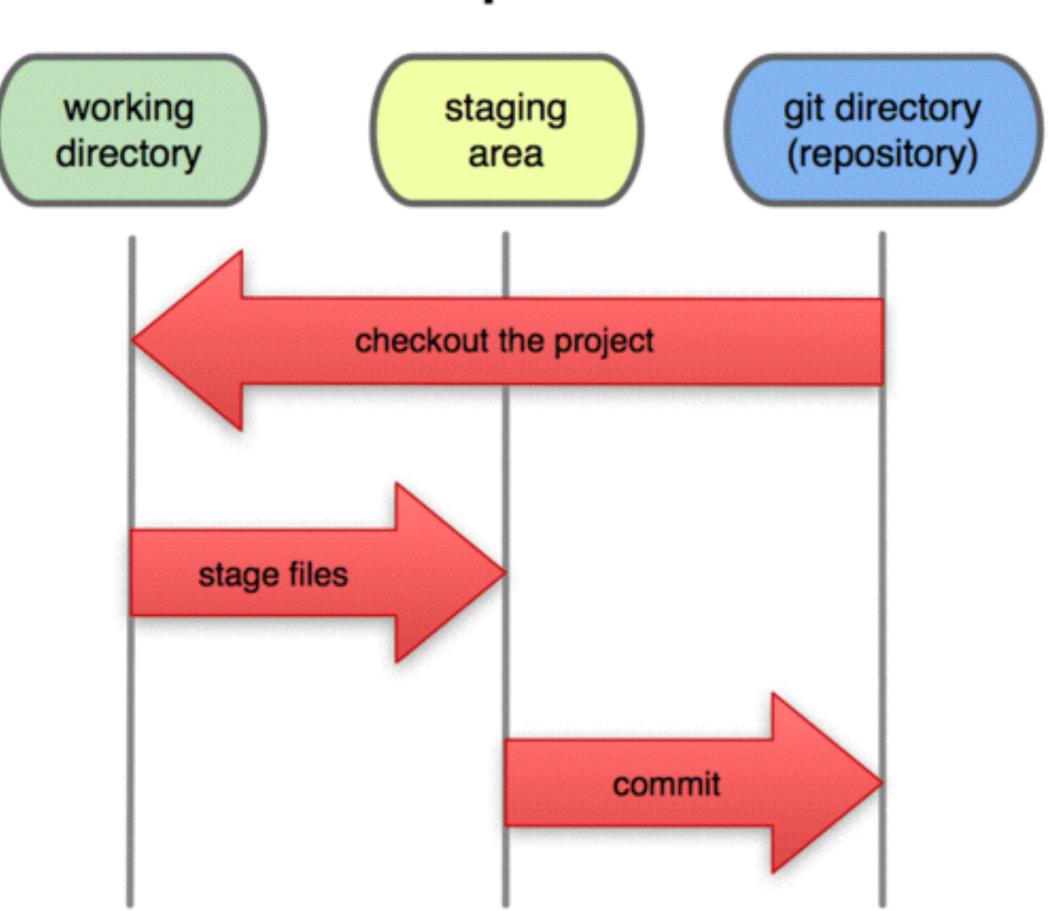

Inside it (usually) is a .git directory with

- The whole history of the repo (all commits)
- config options, branches, etc.

Conceptional staging area

Holds files to be committed

#### **Local Operations**

Working directory

Staging area

# Commit Message

When doing a commit, your editor will be opened so you can enter a commit message

- Short summary line
- Blank line
- Longer description

Try to provide enough detail that you can read the message to understand what changes were made (and why)

Might be easy to remember now, but in 6 months?

You've just cloned a repository from github, cd'd into the repo's directory, and created a new file.

- \$ git clone git@github.com:username/example-project.git
- \$ cd example-project
- \$ vim foo

What command(s) should you run to commit this new file to the repo?

- A. \$ git add foo
- B.\$ git commit foo
- C. \$ git add foo \$ git commit

- D.\$ git add foo \$ git push
- E.\$ git add --commit foo

After adding and committing initially, you've been working on foo for a while and want to commit again.

What command(s) should you run to commit your changes repo?

### Commits

Each commit is (in essence) a snapshot of the repository

Commits are named by a hash of their contents, e.g., c37ce054c766b79a3577aba898b296d3557c3d24, often just the first 7 digits: c37ce05

Each commit links to its parent commit(s)

Individual commits can have human-readable names

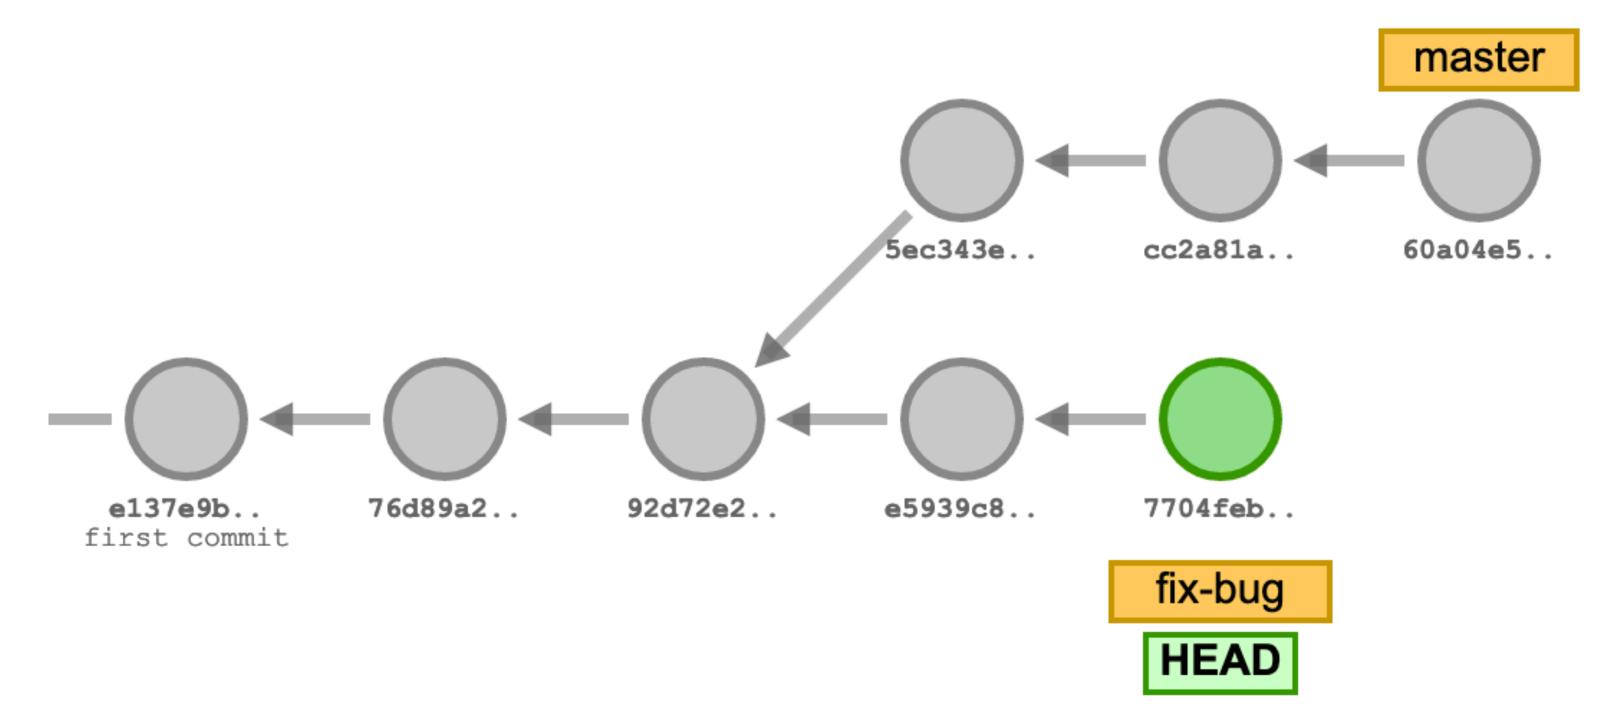

- HEAD is the currently checked out commit
- master is most recent commit on the default branch

After two commits, HEAD and master point to the second commit

After a third commit, HEAD and master point to the third commit

### HEAD!= master

We can create a new branch fix-bug and commit to that branch

We can also keep committing to master

HEAD points to the branch we have checked out

### Pushing to the remote server

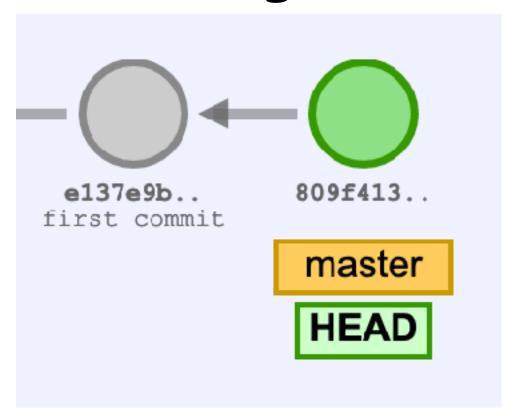

```
$ git push
```

Sends to the remote server all of your committed data (it doesn't already have)

#### Remote servers are called remotes

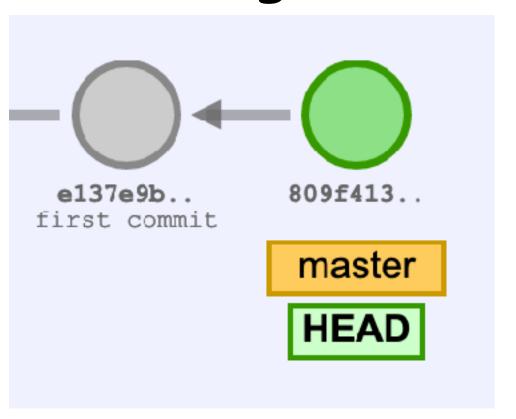

- When cloning, the remote is named origin by default
- ► Remotes have their own branches origin/master is origin's master branch
- It's possible to have multiple remotes (but we probably won't in this class)

#### Local repository

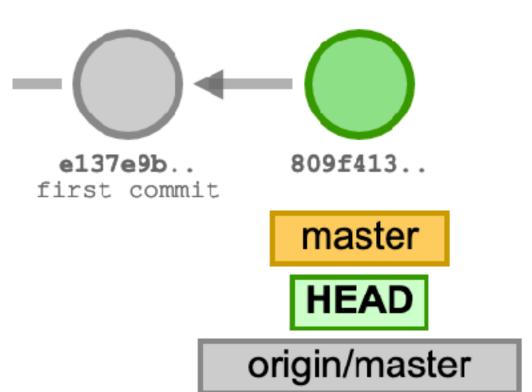

#### Local repository

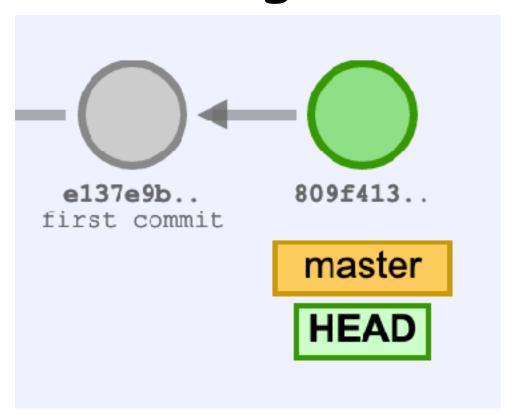

\$ git clone ...

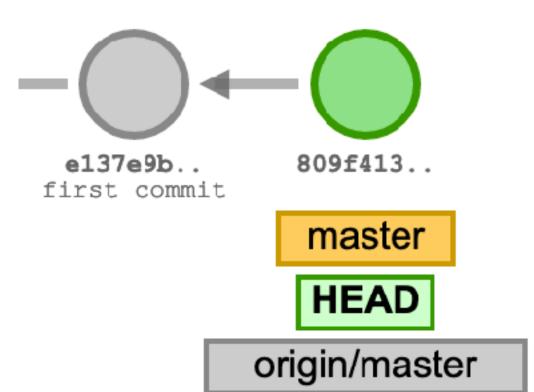

\$ git clone ...

Local repository

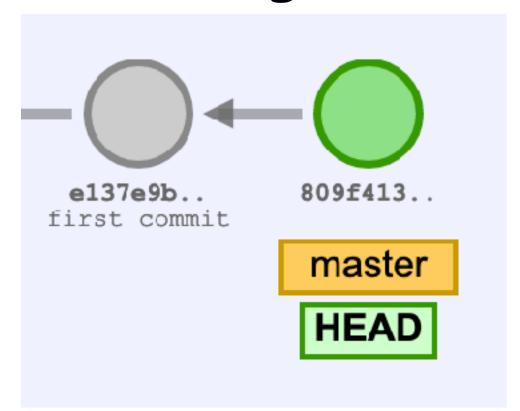

#### Local repository

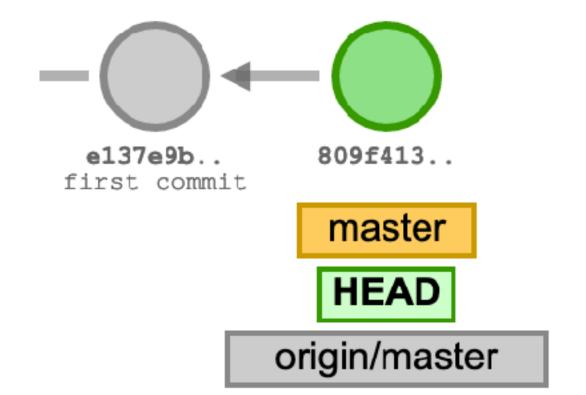

```
$ git add ...
$ git commit
$ git add ...
$ git commit
```

\$ git clone ...

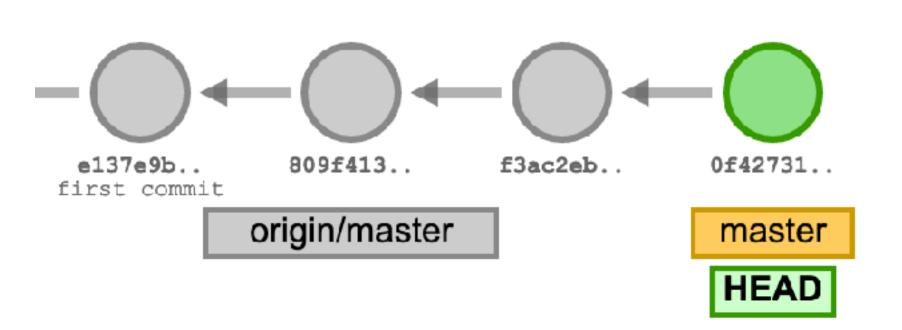

\$ git clone ...

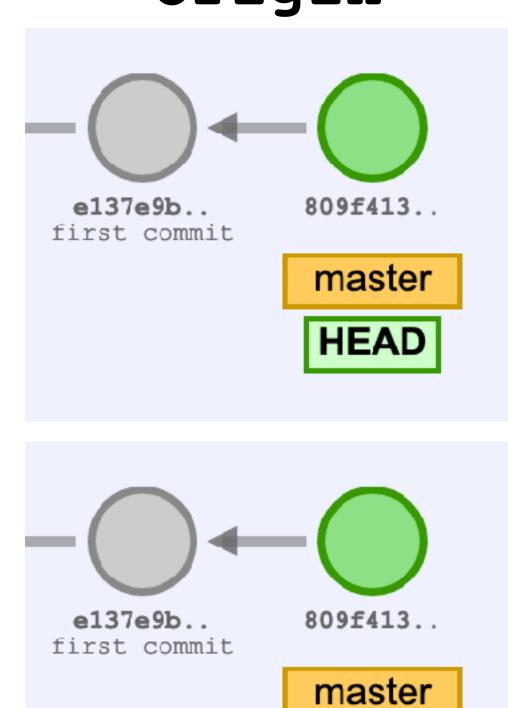

#### **Local repository**

```
$ git add ...
$ git commit
$ git add ...
$ git commit
```

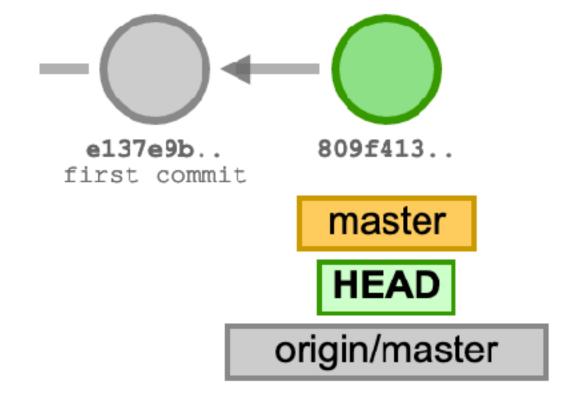

#### Origin

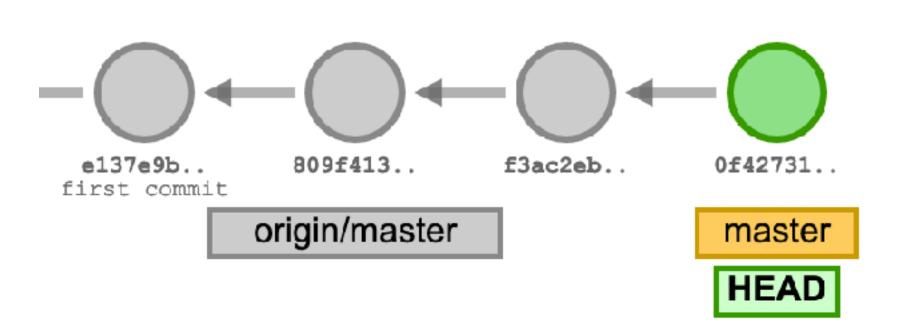

HEAD

#### Local repository

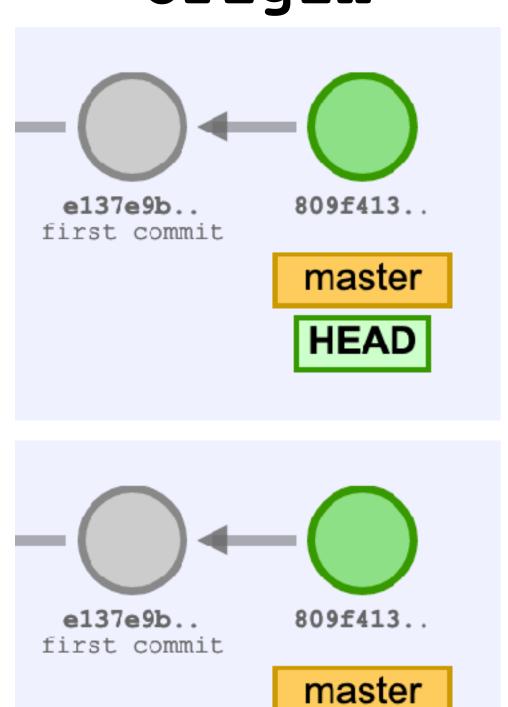

```
$ git add ...
$ git commit
$ git add ...
$ git add ...
$
```

\$ git clone ...

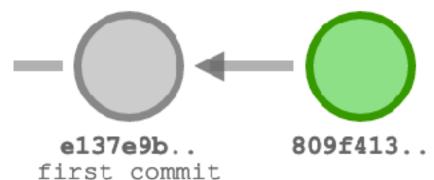

\$ git push

#### Origin

HEAD

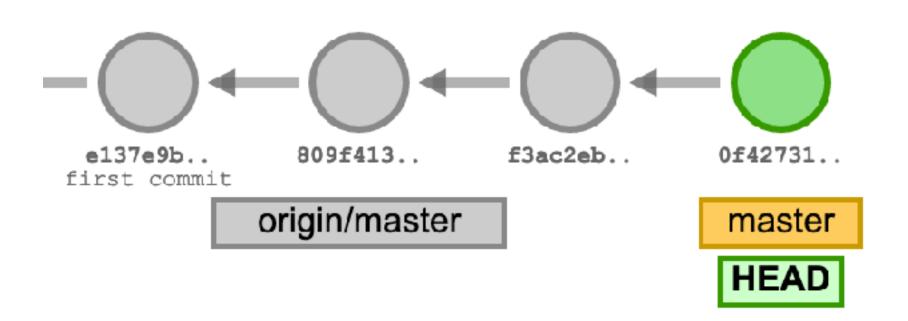

#### Local repository

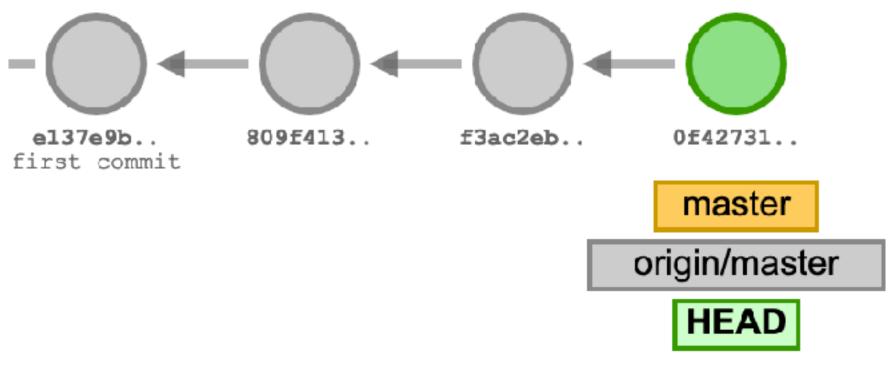

\$ git clone ...

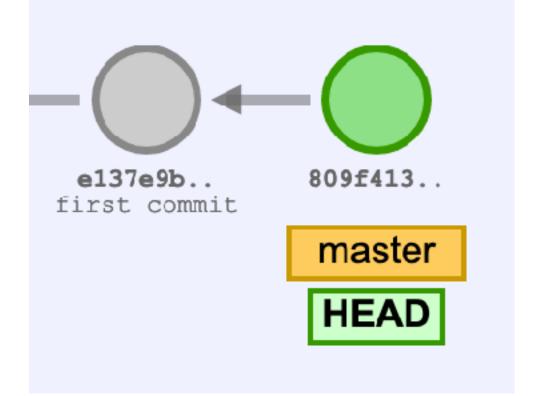

master
HEAD
origin/master

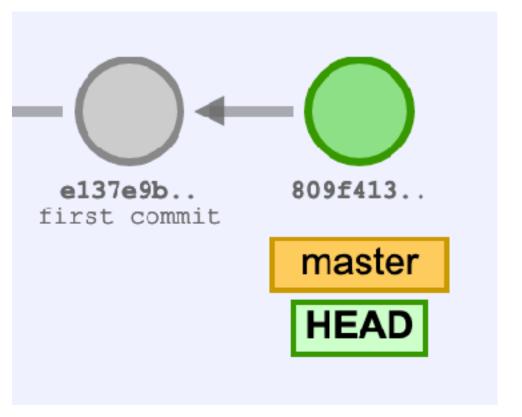

\$ git add ...
\$ git commit
\$ git add ...
\$ git commit

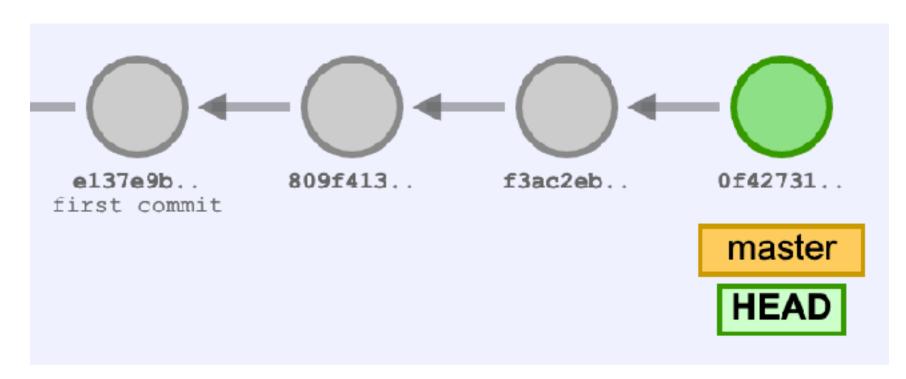

\$ git push

# Pulling from the remote server

```
$ git pull
```

Pulls changes from the remote server to the local repo and merges with the local changes

```
$ git pull --rebase
```

Pulls changes from the remote server to the local repo and rebases local commits on top of remote commits

# Pulling with merging

Commits from the remote will be added to the local repository

If there are local commits, git tries to merge them by creating a new commit

```
A---B---C master on origin
/
D---E---F---G master
^
origin/master in your repository
```

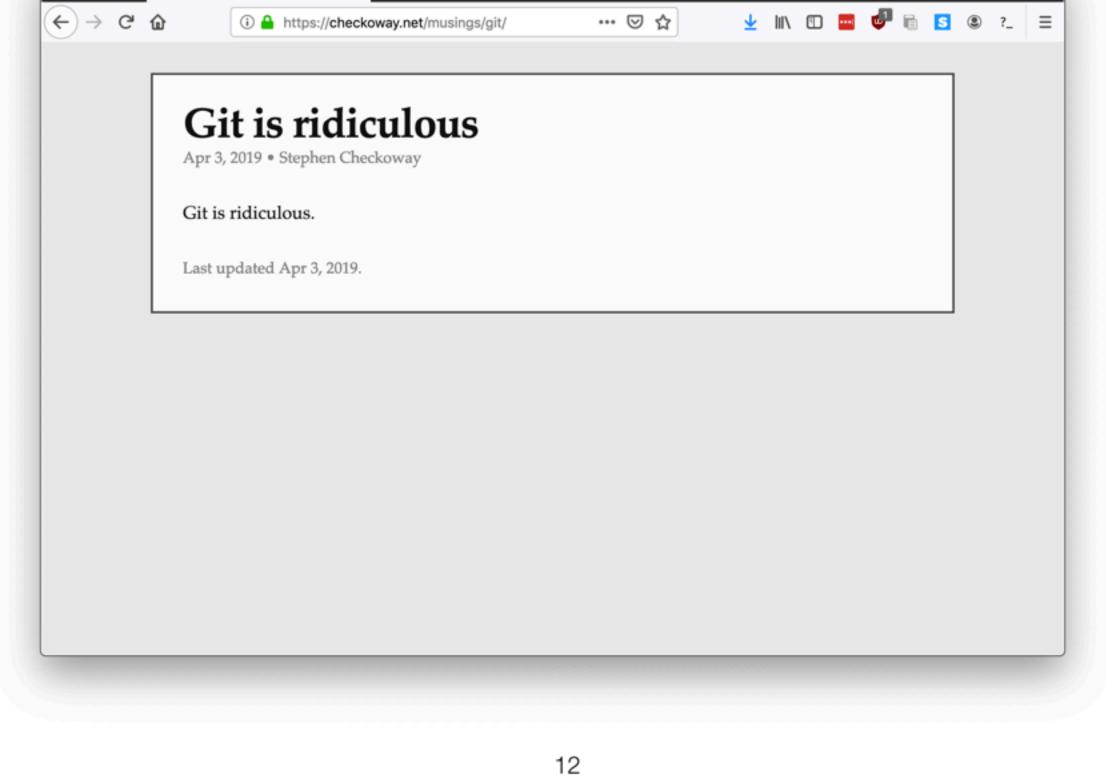

# Pulling with rebasing

Commits from the remote will be added to the local repository If there are local commits, git replays them on top of the new commits

```
A---B---C master on origin
/
D---E---F---G master
^
origin/master in your repository
```

### Reminder: Git is ridiculous

# Warning: Git is ridiculous

# Gitting help

```
$ git --help
$ git init --help
$ git clone --help
$ git add --help
$ git commit --help
$ git push --help
$ git pull --help
```

### Commit often

Commits are cheap, commit often

Commits can be reverted by git revert

- Makes a new commit that undoes the old commit
- \$ git revert (commit\_hash)

Commits that haven't been pushed can be undone completely by git reset

\$ git reset --hard (commit\_hash)

Demo at <a href="https://git-school.github.io/visualizing-git/#free-remote">https://git-school.github.io/visualizing-git/#free-remote</a>

### In-class exercise

https://checkoway.net/teaching/cs241/2019-fall/exercises/Lecture-05.html

Grab a laptop and a partner and try to get as much of that done as you can!
